

Travis Air Force Base Environmental Restoration Program

Site LF008

September 2020

Site Name: Landfill #3

Site Description: LF008 was an inactive historical landfill consisting of a series of small, unlined trenches used to dispose of old pesticide containers. This disposal resulted in groundwater contamination with organochlorine pesticides, primarily alpha-chlordane. The containers and contaminated soil were excavated in 2003, and residential soil cleanup standards were achieved.

The list of chlorinated COCs for LF008 groundwater includes aldrin, alpha-chlordane, heptachlor, and heptachlor epoxide.

Selected Remedy: The Travis AFB Groundwater ROD (CH2M HILL, 2014) selected Alternative 2 (Monitored Natural Attenuation) to address the residual pesticide contamination.
