

Travis Air Force Base Environmental Restoration Program

SD045

September 2020

Site Name: Former Small Arms Range

Site Description: The former Small Arms Range is a decommissioned facility in the southwest portion of the base that was used for small arms training. Lead, anti-mony, and copper were detected in the soil.

Selected Remedy: The West/Annexes/Basewide Operable Unit Soil ROD (CH2M HILL, 2002) selected Alternative S6 (Excavation/On-base Consolidation) to address the contaminated soil at this site. In the summer of 2007, Travis AFB carried out a soil cleanup action at SD045. All of the contaminated soil was excavated and placed in a Corrective Action Management Unit (CAMU), located at Site LF007. The soil cleanup action achieved residential cleanup levels for all chemicals of concern, so there are no Land Use Controls in place at the site. The results of the soil cleanup action are presented in a 2008 remedial action completion report for multiple sites. Since there are no other media of concern associated with the former Small Arms Range, Site SD045 is closed
