

Travis Air Force Base
Environmental Restoration Program

Site SS030

September 2020

Site Name: Monitoring Well 269 Area

Site Description: SS030 is in the southern part of the NEWIOU and consists of a solvent plume from unknown historical activities on undeveloped land near the southern base boundary. The COC plume extends onto off-base private property that is used for animal grazing.

The list of chlorinated COCs for SS030 groundwater includes trichloroethene (TCE), chloroform, bromodichloromethane, and 1,2-dichloroethane (DCA).

Selected Remedy: The Travis AFB Groundwater ROD (CH2M HILL, 2014) selected Alternative 3 (Groundwater Extraction and Treatment) to address the residual dissolved solvent contamination.
