

Travis Air Force Base Environmental Restoration Program

Site SS041

September 2020

Site Name: Building 905

Site Description: Building 905 is the Base Entomology shop. The surface soil within this fenced facility contained various pesticides (chlordane, heptachlor epoxide, and toxaphene) from the past washing of pesticide-applicator vehicles on a concrete washrack. The local groundwater also contained low concentrations of pesticides.

Selected Remedy: The WABOU Soil ROD (Travis AFB, 2002) selected Alternative S6 (Excavation/On-base Consolidation) for the soil. The base completed a soil remedial action in 2003 and achieved residential cleanup levels. The Groundwater Interim ROD for the WABOU (Travis AFB, 1999) selected groundwater extraction and treatment (GET) for the contaminated groundwater. The GET system cleaned up all groundwater contaminants to below detection limits. The Travis AFB Groundwater ROD (CH2M HILL, 2014) documented the closure of this site.
